

Live Captioning by AI-Media

SPEAKER:

We should be getting set up. It looks like we are set up because I see the closed captions. Our captioner is ready. For anyone who needs it you can go ahead and initiate that capability in your Zoom screen.

It is 3:01 PM and there's a full presentation so we will go ahead and get started. My name is Rebecca. I am a translation manager and I always forget to hit record. Let me hit record.

My name is Rebecca and I am a translation manager at Think College National Coordinating Center. Happy to be here today. I think everyone here is familiar with Think College national recording Centre by now

Think College is an organization dedicated to improving education for people with intellectual disabilities. We provide technical assistance as an many resources and postsecondary opportunities for students whenever possible. Today's webinar is being presented by Meg Grigal and Clare Papay will find out about all of the data we have been collecting for the last 10 years.

You will see your own muted but you can chat or ask questions. Feel free to ask a question in the chat for panelists and attendees if you like at any time during the webinar. I am not sure if there will be time at the end for a real Q&A session, but please put your questions and Megan Claire will try to answer as we go. If there are any questions that we don't get to we will circulate the answers at a later date.

Again, this webinar is being closed caption so you have that option and it is also being recorded. All of the resources related to this webinar will be available or are available now at the website I just put in the chat. The handouts from today's webinar and an additional handout on resources from the webinar are available now, that is also where you will find the recording. I think that is it for me. I will turn it over to Claire and Megan.

MEG GRIGAL:

Thank you. I am Meg Grigal. Claire, do you want to say hi?

CLARE PAPAY:

Hi, everyone. I am Claire.

MEG GRIGAL:

We are excited that so many of you showed up to hear about data, because sometimes that's the biggest draw. We will share some information with you.

As Becky said it was so much fun putting this together. We will try to answer your questions in the chat. If we don't get to them we will circle back and answer them post webinar. It's Becky set? We are from the National Coordinating Center's that is been around since 2010. Institute for Community Inclusion at UMass Boston where he worked with all-inclusive higher education programs, some funded by TPSID and some funded and others-- ways.

Pretty much anyone interested in inclusive higher read we are here to help you. If this is your first time coming to one of our treaties you can go to our website and take a look at the other resources we have for you.

One of the aspects of the National Coordinating Center's scope of work is to work with through coordination, training and evaluation the transition to postsecondary programs for students with intellectual disabilities. It is a great program with a slightly less than great acronym but the goal of the TPSID program is to create high-quality inclusive programs that support positive outcomes for students. We have been working with three cohorts at EPS ID and much of what we are going to share has been learned has been in data derived from the initiative.

To give you some concepts-- context, partly because we work with them, they probably get a lot of airplay. There's a lot of information on our website and in our data, but they represent only one third of the higher education programs in the United States. It's important for us to keep in mind that doesn't make them better or more important than all the other higher education programs that are working so hard to support and extend access to higher education for students.

They are group of programs that we have the most data on, so they have informed us about what works and where the gaps and cracks are. There are 310 programs in the country and TPSID represents about 1/3. Since 2010 there have been 120 institution of higher education with TPSID grants and associated sites in 34 states. That's a pretty broad swath of what is out there.

You can see the map of where the programs that were funded between 2010 and 2021 relocated. There are some states that have never had a TPSID, much to their chagrin because many have tried really hard. We are not involved in the funding of the TPSIDs but I think it has created change and growth in states that have been able to secure that funding.

This is quick and dirty by the numbers. Across the three cohorts each of the five year grants at TPSIDs were funded into 15, 2020 and most recently October 2020 cohort three was funded. You can see there were 27 grantees in the first cohort. In 23 states with 58 programs serving 2167 students. Cohort there were 25 grantees in 19 states that works with 65 programs and serves 2122 students.

In cohort three we have three grantees. In 16 states. The numbers keep kind of thing down. I would not be surprised if the programs go up. Any of these programs were up for consortia so the grantee is not the only number captive. We don't have any students quite yet, that still in development.

Here is the grantee's in the first two courts. The map might be kind of small. The slides are available for you so you can blow it up to your heart's content as you look at it on your own computer. Cohort one are the red stars, cohort two are the blue stars, and then the blue stars with the red highlight is cohort one and two. Some tips that were funded between 2015 and 2020, and in some cases some of those were refunded in 2020.

So, here are the current grantees. The list of the programs is aside the map. There are some new states that have become part of the TPSID program, we are still in here won't-- year one and it will end in September 2021. We are still in the process of launching and collecting the first year of data from those cohorts. As you can see it represents a significant version around the country. It's not a representative example so I want to make that clear as we are sharing data.

With that I am going to turn it over to Claire to start sharing what we know about TPSID cohort two year five.

CLARE PAPAY:

My neighbour just got on his motorbike. Why does he do that? Perfect silence and then somebody drives fine. Thank you, Maggie.

One of the things we do is collect data from all of the TPSID projects. We collect data on a few things. We collect data on the programs themselves, how they are structured, the kinds of supports they provide, the partnerships they have. We collect data on the students who attend TPSID programs. Both our demographics as well as the activities that they do each year. What they are doing when they exit a TPSID program and then also we reach out to them to ask them for outcome data.

The kinds of activities they are doing after they complete the program. We have both the program data and the student data that are reported to us on an annual cycle. Our data collection is followed by academic year and TPSID projects report to us each year things to do with both their program and students.

What we are presenting to you today are some of the data from the 20 19th to 2020 academic year which is the most recent year for which we have data completed.

The new cohort like I was just telling you about which is cohort three started this year. They are still in the process of reporting data to us. That will continue until the end of the summer.

The data we are sharing today is from the last year of cohort two, year five, the second cohort of TPSID projects. We'll share some data with you on academics, employment, credentials. We have outcomes in all kinds of good stuff.

Let's start with academics. In the 2019/2020 academic year we had 956 students altogether if I remember correctly, all but 20 of them were enrolled in courses. Enrolling in courses is something that almost all students at TPSIDs are doing. Programs on college campuses. That's an important point of their schedule.

Those students enrolled in 6750 courses which is an average of seven courses per student per year. We separate course data into whether those courses are inclusive or specialized. Inclusive courses are college classes that are open to all students that are in the course catalogue, not designed specifically for students with intellectual disability. They are regular college classes that anyone else can take.

Specialized courses designed for students with intellectual disability often those students are together in a group or some part of instruction focused around things like life skills, social skills, all kinds of things. We break down our data into inclusive and specialized. We focus a lot of our attention and support that we provide about TPSIDs on access to inclusive courses and we will share a little bit about that later on, but access to inclusive courses is really important. It is an important predictor of some other outcomes as well.

What you can see on this line-- slide is that the ratio between inclusive to specialized was increasing towards more inclusive process over time. We started off in the first year of cohort two with 43% of all course enrolments being eaten inclusive courses, and that has increased over time where we got to 62% of course enrolments from 2019/2020 academic year in inclusive courses. This is something we think is really fantastic and it is something we have supported throughout the TPSID and the worked really hard to find ways to increase act to assess courses for their students.

We hope that goes over time even more. It has been growing since 2010. In terms of the kinds of courses students are taking and TPSID projects anything you can think of. Any course in the course catalogue. Putting together this last of the data that was reported to us there were so many we can even put on this line. You can see students are taking introductory courses as well as more advanced courses, so we are not just talking about those basic or developmental kinds of courses but anything you can find in the catalogue is something students are accessing.

A lot of students are also accessing forces that help prepare for a specific career or job. You will see fundamentals of food preparation, principles of marketing, things like that to work towards a specific

career they are looking to have.

Meg, I will hand it over to you.

MEG GRIGAL:

I will say the lessons learned are not related specifically only to the cohort two year find data. These are the lessons we have learned over the past 10 years. I want you to recognize this is not all mapped to the data.

The first lesson is prioritizing inclusion from the start. It is really challenging to undo a specialized course once you have created it. You send this implicit message of students with ID don't belong in the typical course, because of their learning style or their learning needs require specialized instruction.

There is messaging that occurs that is implicit and exquisite. We have heard multiple times from places in a more specialized way and transitioned to more inclusive that they wish they had just started with inclusion.

The second lesson ensure students get access to advising and transcripts. As students but short of these programs the advising is critical because typical academic advisors know all of the instructors. When the program they only know the instructions for they have the student placed for. So, many people use person centred planning as part of the advisement process, we support that and we think it works but we also think advising access to typical advisors and access to typical transcripts are very important in addition to just good practice they are also predictors of inclusion.

We did a particular study that demonstrated that the students that have these things were more likely to be included. And then finally set clear expectations with faculty about the student's goals, roles and mentors and lines of communication. Our colleague Allison Taylor and Zaria (Unknown Name) had a steady put together with experienced faculty perspectives, those who had taught more than three inclusive classes. There was some confusion about what the student expectations were, what the role of the peer mentor was, who I talk to? What are my expectations about grading? All those expectations for academic we can do a whole session on it, but it is worth having a very clear conversation with faculty as a sign up a student in an inclusive class.

CLARE PAPAY:

The next thing we will talk about his residential options and supports. Whether students are living on campus or where else they might be living where they are enrolled in their TPSID program.

The data on this one is a bit tricky because some TPSID programs are at schools that do not offer housing to anyone. For example, the community college or some other kind of college that just does

not offer housing. We try to make that clear. We are not expecting all TPSID programs to offer housing if the campus does not offer housing. So, there were 41 TPSID programs last year that relocated at what we call residential schools. They offer housing to some of their students. Two thirds of those offer housing to TPSID students, and 14 of those did not offer housing.

Housing was not universally available to all students, even if it was available to other students by campus.

Two thirds of all of the students lived with their family while they were enrolled in a TPSID program. 22% lived in I use the term IHE which is institution of higher education. Some type of campus housing. 12% lived in on-campus housing and not with family. Some other living situation.

A large number of students lived with their family but we are seeing some students who are able to live in campus housing when it is available.

Some of the supports that are provided to students who are living in housing include accessing the residential assistant or advisor available to all students, having some intermittent on-call support staff, and then less frequently having uncompensated roommates or sweet mates to provide support to the student.

MEG GRIGAL:

Housing I think has always been a challenge. I feel like the attitude in many cases, not in all, is starting to change. Collaborating with residential campus housing from the beginning is really the way to go. There are a few programs I have been talking to who are currently in development launching next year and they brought housing to the table right away, and housing actually had done their own work and reach out to existing programs that offer housing to get the lay of the land. The thing you want to remember is housing is used to support students who are clueless. Most college freshmen, I have a college daughter who is going in the fall. They don't know what they are doing.

There are existing programs and having the college students with intellectual disability as just another group of diverse learners who need support is a great way to go.

Another lesson learned is ensuring choice and access to campus affiliated housing. 10 years ago, seven or eight years ago, there was a certain door where the students lived or there was a certain house where they went, just a house for students to have on campus. It was still in some ways kind of segregated.

I have seen a huge shift in programs where the housing offerings are more integrated and the housing offerings are more diverse, whereas you might want to live in this dorm or this sleek they are beginning to become more available.

I think the last lesson is that we really need to design residential supports around the needs of the student working with residential life. Again, it doesn't want to be like everyone else does this, but if you have a question about so-and-so you only talked program staff. Working with resident advisors, IRAs, working with student life leaderships to know what would make sense, what has to be program specific support versus what might be a modified support that would come from a typical staff.

I think those are all conversations you need to have.

CLARE PAPAY:

The next thing we are going to talk about is career development and employment. This is a big one for us. One of the main purposes of enrolling in an assistant program is to prepare for competitive employment. We collect a lot of data around Paul's career development and employment of students at TPSID programs.

The data from this academic year is a little tricky, no surprise. This is the year in which COVID-19 hit and campuses are closed, everyone went home. We did not see so much of an impact on academics. Verses were able to move online and TPSID programs figured out how to support programs in that online setting, but when it comes to employment that is obviously much harder. A lot of students were not able to continue in employment positions.

We will explain some of the trends we were seen over five years over the cohort to data that were impacted in the fifth year. We will explain to you where those trends were thrown off a little bit.

Starting with career awareness and exploration. This is that ground-level work around making sure students are beginning to think about careers and all the careers that can have. Most students enrolled in TPSID programs enrolled and participated in at least one of these activities. Most common activity in this category was creating and advising a resume. Almost 80% participate in that. Then things like interest inventory, mock interview, getting references together, labour market research, attending a career fair, all of these activities were fairly common across students enrolled in TPSID programs.

When we look at work-based learning it depends on the student or the program. Some were accessing paid work-based learning and summer accessing unpaid and some are doing both. Paid work-based learning experiences are things like internships, student enterprise, work training experiences, student receives some pay. About 17% of all the students in TPSID programs last year had at least one paid work-based learning experience.

They have a total of 327 paid work-based learning experiences. There were almost 100 students who had more than one paid work-based experience during the year.

Two thirds of these work-based learning positions were paid at or above the federal minimum wage. Which is obviously what we would expect, but we see 1/3 of those positions being paid along minimum wage. This is something that is concerning and worthy of more attention.

In terms of unpaid work-based learning 42% of TPSID students had on East work-based learning. More unpaid than paid work-based learning. Again, a lot of those, a good number of those had more than one unpaid learning experience during the year. 62% were unpaid internships and some were unpaid service learning experiences as well.

When we look at the impact of COVID-19 on the number of work-based learning positions held by students in the 2019/20 academic year there was a pretty significant drop in the number of work-based learning positions from February to March.

February, the chart we are showing on this particular slide is showing both paid and unpaid work-based learning combined. In February last year students had almost 600 work-based learning positions, that dropped to a little over 200 in March. It remained low for the remainder of the year. This is one area in which there was a significant visible drop because of campuses closing.

We also look at paid employment. Paid employment we define as students having a job for the purpose of earning money. This may not be a job that is preparing them for a particular career, it could just be a job they are holding to help them earn some money that supporting their enrolments in college programs.

About 1/3 of students, 32% were engaged in paid employment while they were enrolled. In 28% of that 32%, 85 students, had more than one paid employment position during the year.

We did see a drop in the number of employment positions as well because of the impact of campuses closing and COVID-19. So, in February of last year there were about 300 positions that were held by students, employment positions, then dropped to about 200 a month later.

Some impact here. Not quite as much as visible impact as it was for the work-based learning. Some students were able to hold on to their paid jobs, either working remotely like most of us did, or they were essential workers and so they continued to report to work as they had been doing all along.

For the purposes of comparing data over time we also report paid positions which combines data on

both paid employment and paid work-based learning. We made a little bit of a change in how those paid work-based learning positions were reported to us. A couple of years ago. For the purposes of being able to compare over time this data point percentage of students who had any type of paid position we combine those together-- paid position we combine together. 44% of students had at least one paid position while they were enrolled last year.

We will compare these data to other college students and then to individuals, adults with intellectual disability in general.

When we look at this percentage of students with any type of paid position we want to make a comparison to the percentage of full-time undergraduate students who were employed and we use data from the National Centre for education statistics to do this.

This is data on college students in general. Not with disabilities in particular, not with intellectual disability, but any college students, full-time undergraduate students.

That percentage, the percentage of students who are employed over time, all the way back to 2010 to now is kind of hovering around 40%. The most recent data point we have is 2018/19 in which that percentage was 43%. 43% of undergraduate students were employed.

The percentage of students in TPSID programs at a paid job compares very favourably to this percentage. We started back in 2010 and 27% of students with a paid job with TPSID programs. It has grown over time. We hit a peak of 53% in 2018 to 19 academic year and then with the impact of COVID-19 it dropped off to 44% last year.

We were very much hoping until campuses closed and the world ended that this number was going to increase that last year of the cohort. Unfortunately that was not the case. But even with the impact of COVID-19 we still see a very favourable comparison between students and TPSID programs and full-time undergraduate programs students.

To give you some data on student employment at exit for context free hundred 42 students exited the TPSID program in this academic year. 73 of those students had a paid job on exit, 216 were engaged in career development experience. That would be further preparation, exploration but not actually having a paid job. Two students went on to further postsecondary education.

When we look at the impact of COVID-19 on employment at exit this is where we see a very big drop. 2018/19 academic year 52% of students left a TPSID program with a paid job, which was great. We were hoping that number would increase for 2019/20. Instead it went in the opposite direction. 21% of students exited the TPSID program and had a paid job either at the point of exit within 90 days, that was a substantial drop for this year's data and not particularly surprising given the state of the

world at that time.

We are going to put these data into the larger context by comparing with other adults with intellectual developmental disabilities. Our comparison here is this data from the National employment indicators and we are looking at the percentage of adults who are certified state IDD agencies who have a paid job. Going all the way back to 2010 the percentage of adults kind of in the general population with IDD at a paid job hovers between about 14% to 19%. Not a very substantial proportion of adults with IDD who have paid jobs.

When we compare that to the students exiting TPSID programs with paid jobs we started with 16% in 2010 and this has grown over time. All the way up to 2018/19 where we stop as I showed you 52% of students exited with a paying job. This particular trend graph was looking fantastic. All the way up to 2018/19. It pains me to even show you what it looks like when we pull in the data from 2019/20. It takes a nosedive there. If there

Not much anyone could have done about it. Certainly as things adjust and go back to normal, some kind of normality, this particular trend readjusts and heads back up in the other direction.

Over to you. Lessons learned.

MEG GRIGAL:

I will say there has been some questions in the chat. I have answered a few of them. Many of the answers are in the report and I'm happy to them for you, but I did want you to be aware that the annual report of all the TPSID data we are sharing is available. I put the link. I know there is a resource list and handouts, it sounds like there were some glitches with the links and the team is working on getting most sordid. At the end of this we will be all set. Letting you know what's going on.

Lessons learned. Our biggest lessons learned in the past year is that the pandemic impacted employment like it did for everyone. Yet another theme we have learned. If there's something that has worked or does not work for the general population it also works or does not work for people with intellectual disabilities. Like the connection between going to college and getting a job is very strong for most people, it is also strong for people with intellectual disabilities.

We have seen, and it continues, a continued emphasis on unpaid work while enrolled. There is an absolute need for work training, work-based learning, those are positive pieces. What we have found is the thing that predicts work is employment. If you want students to leave a program with a job they need to have a program while they are enrolled. Then they are more likely.

I think one of the reasons we made the data so granular in terms of career development information,

what activities they were doing for employment preparation, activities for career awareness was to find out which of these things work and which of these are just what we do. Whether it's in transition or in higher education, but do they actually lead to employment?

Or hoping in the next few years to have enough data to ask that question and have some meaningful answers of what pieces of employment services are integral and vital to attaining paid employment.

Those are just the snapshot lessons.

CLARE PAPAY:

Just trying to answer question while you were talking mayor. We have a couple of more areas to talk about. Let's talk about credentials. I think there was a question about that earlier so this follows under the category of credentials. This has been an area of focus also for us at the NCC in terms of the support students are provided with TPSIDs. Something programs have worked on over the five years to develop credentials or to improve and create access to other credentials.

By this fifth year the cohort two TPSIDs were able to earn a credential with all 58 programs which is great. 56 programs, all but two creating a TPSID production. They create a credential that was specifically for and awarded to students who enrolled in that TPSID program. The other two programs went about this slightly differently. They found ways for students to earn and get access to credentials that were already offered at that institution of higher education.

For those credentials that were developed by TPSID programs 57% of programs offered the TPSID specific credential that was approved by the institution of higher education. A little over half of those programs took their credential through their campuses governance process in which the credential becomes unofficial offering of the college or university.

This is something we know is important for them to do in terms of both sustainability, legitimacy of the program, in terms of the students having a valuable credential. That means something and they exit and take that credential to an employer. We will touch on this again in a few minutes when we talk about some of the other findings as well.

And then eight programs offered a credential that was aligned with an existing labour market credential. Designed for students for particular career or gave them a credential that was aligned with something that's existing in the labour market. An example of that is one campus offered a credential from the National retail foundation, which is for people who are working within retail and it is a credential that is established and they created access to back credential for students in that program.

When students got to the point of exiting the program 79%, almost 4/5 completed their TPSID program

and earn a credential, the others left early for various reasons. But we are a very substantial percentage of students who are completing the programs that they enrol in.

The most frequent type of credential that students aren't, not surprisingly given this was the most frequently offered to them, was a credential developed by the TPSID program. So, 218 students aren't 246 credentials. Some were able to earn more than one TPSID created credential as part of the program.

That's related things-- that's the last data point on this one.

MEG GRIGAL:

I was in the middle of taping in answer to Hannah's question. I will get back to, Hannah. So, credentials take a lot of time. The TPSID program and the guidance from the RFP and OP and the US DOT was minimal. There is no definition for meaningful credential. The (unknown term) was allowed to create their own definition of that. Everyone came at it from a different place.

That gives flexibility but it also creates some havoc. It has taken some time for us to get some infrastructure on credentialed development guidance and what it should look like. Credentialed development is also been impacted significantly by WIOA and their definition of industry recognized credential. One of the questions in the chat box is about are any of these credentials recognized on the VR? It depends on the VR agency. And it depends on the credential.

There was some guidance put out by RSA that said any credential from inclusive hired program did not meet the definition which was not accurate. But there was guidance that came down and people misinterpreted. It's a challenge. It is a challenge we are continuing and will continue to have dialogue about in terms of what credentials meet the definition of industry recognized. Some new guidance from RSA has recently come down. We hoped it would clear it up but getting it from guidance of the state level down to the counsellor level takes time and takes repetition.

The other lesson in one and three, two IHE approval matters because you want people to walk away with a credential that is not only meaningful within a program, but is also meaningful to another IHE if the student wants to go on for further education or transfer, also why they need a transcript, and also is going to be recognized by an employer.

The days of I am going to bring you a certificate that's only recognized by my dotmatrix printer because it's 1983 those days are over. If you want a credential that is going to mean something to a student in long-term the credential ultimately needs to be issued and approved by the IHE that is offering it.

Am I doing outcomes or are you?

CLARE PAPAY:

I will do that right now. We're going to talk about outcomes and then we have some other relevant findings, then we will wrap up. So, we asked TPSID programs to reach out to their graduates annually to have them fill out a short survey about what they are doing. When we look at students one of the first things we ask about is whether or not they have a paid job.

The data that we have, and these data as of September 30, 2020 which is only compiled data for when we cut off the data for the annual report that you will have a link to. We saw that students were one year out of their TPSID program and 59% of them had a paid job. And then this percentage increases over time. 66% of graduates who were two years and of their program had a paid job, 66% for three years out had a paid job. We are seeing some really strong outcomes, especially when you think back to those early numbers we shared with you around the percentage of adults with intellectual development disabilities in general will have the paid job which is kind of that 14 – 19% number. We are seeing a much greater percentage of individuals who complete TPSID programs who have paid jobs and this is increasing over time.

Not just immediate effects but just increasing as time goes on.

We are also seeing a strong impact on social life. Satisfaction with social life is something that individuals with intellectual below developmental disabilities really struggle with -- with developmental disabilities deal with. 92% of respondents reported they were satisfied or very satisfied with their social life. We are seeing that they are perhaps attending a college program like the TPSID program is helping students make social connections that lead to greater satisfaction with their social life even after they exit the program.

In terms of living arrangements we are again seeing some strong outcomes in terms of where students are living. So, as of the day that we are looking at today, September 30 cutoff point, for those students graduates were one year out of the program, 53% of them were not living with family. That's a pretty substantial percentage. This increased 20 percentage points from the last time we looked at the data which was the year before.

When you look at those graduates two years of the program remains high. Before percent of them were not living with their family. That's up 14 percentage points from the previous year. Strong outcomes in terms of students being able to move out and live more independently.

We are also seeing some students who are going on to further education. 26% of those graduates who are one year out of their program reported that they were pursuing further education. Again, this is

another really positive aspect that students are choosing to continue their education beyond the TPSID program.

I guess we're moving right onto some of the relevant finding. I think I'm going over to you for sharing these slides.

MEG GRIGAL:

In addition to the annual data collection that we do with TPSIDs we also saw in some cases additional funding to work with TPSID data, in other words trying to roll it into our existing reports all about timing and resources. It would be good to share some of the other things we have discovered through TPSID data in other studies.

So, in cohort one we actually invented-- embedded a self-determination that work with partners in Candace-- Kansas to collect information about self-determination about some, not all who chose to provide that information. We were able to find out that the number of social activities predicted scores on certain scales. The autonomy scale, self-realization scale and the self-determination score.

As we thought about, what does this mean and how we interpret this? Self-determination is an ongoing process. It's not a term typically in higher education, its marketer of art and special-education disability.

Trying to translate that into what this means in practice, social activities enhance self-knowledge. Knowing about what I like and what I believe and what my choices are. Understanding what I enjoyed which is self-realization, and it enhances choice in activities.

The juxtaposition of being offered the opportunity to try new things and then engage in new things has a feedback loop into a students self-knowledge and the choices they make. I think there is more to do. We don't have that... We were not able to retain that in our tool and cohort two and I think it's more useful to do a full study of it on its own and not invented into TPSID data. It is complex certainly worth revisiting.

As I mentioned earlier faculty experiences and attitudes. We did a qualitative study with experienced faculty who had taught more classes and the faculty stop many benefits to having students with ID. The students themselves, to the other students, to the classroom environment and the faculty themselves. But they really did see a need for preparation, different types of communication, ongoing communication and the need for clarity. The different players in real-- involved in students taking inclusive classes.

Under the present that's not happening. The student benefits were increased in inclusive classes.

Faculty found that students with ID were less afraid to ask questions when they didn't understand something and often having the students ask that question allowed for conversations to happen with other students. Without intellectual disability, and that actually improve their understanding of the learning and content. It found classmates gain skills in collaboration and really being more willing to communicate and include students with intellectual disability in their discussions and be more thoughtful and empathetic.

They believed it would lead to greater inclusion later in those students lives.

What's going on, Claire?

CLARE PAPAY:

And trying to reply to Denise in the chat but my computer thinks I am clicking on the slide.

MEG GRIGAL:

Understood. The faculty benefits, successfully managing a diverse classroom led to increased confidence. A lot of faculty indicated they were not sure they could do this, they were not sure if they had the training needed to work with students who had intellectual disability.

I think the take away is they found out they did not need special training to do that. They just needed to remember they were a good teacher and they know their content. It helps faculty consider the range of student learning styles aside from the students with ID. Not only students with ID approach in different ways and have different capabilities and educational experiences, some faculty make comments like, I think that's making this harder for everybody. I have to think about how to translate it for students with ID and I think it made it more clear that I could be using better language for all of my students.

It improved their lectures by listening to the questions posed by students with ID. I think if I need special skills to teach students with ID is one of those myths we need to continually bust

We did a study looking at the perspectives of employment personnel who worked in TPSIDs. This study allowed us to delve a little deeper on employment data from the perspectives of the people who were actually knee-deep making it happen for students with ID.

We found career development and employment was impacting the TPSIDs relation with the host IHE. Access to career services, students access to employment opportunities and workplace learning opportunities on campus. Those relationships were really integral to TPSID program, employment staff that they were engaged and had some partners in supporting students access to employment and workplace learning.

There's a huge disparity in the way people approach things and we did see that the focus was more on unpaid work experiences rather than paid. That is from the employment personnel's perspective, and in some cases they were clear it was intentional and sometimes necessary. Then there was some indication that maybe it was not as intentional, it was just what they had always done.

Leading us to question, why do we make the choices we make for limit services and which of them is actually getting us where we want to be versus which of these are habits of practice.

In a couple of predictor studies. One on predicting inclusion, academic inclusion and one on gaining employment. We found enrolling in specialized classes negatively associated with both having a paid employment in the program and enrolling in inclusive classes. We found unpaid career development experience are not a significant predictor of students getting paid employment during the program. There's a lot to unpack there and there's a lot to study so I don't want to over emphasize that finding, I think it has led us to question how, when and for how long employment plays a role on students experiencing college.

Students who obtained paid enrolment-- employment while enrolled were more likely... Access to regular advising and earning an official transcript in a paid job... Enrolled in more inclusive courses.

The predictors of inclusive horses were paid job....

Predictors of paid employment at excess included earning a credential which almost double the odds of having a paid job at exit.

I know this is a time and there's a ton of questions and we only have three minutes left. I am going to say this because I think this is really important for us as a field to acknowledge and honour the work of the hundreds and hundreds of staff and faculty and students who have been involved in the TPSID program. The model demonstration program has demonstrated what is possible when high expectations are paired with expanded opportunities and sufficient resources. By creating viable paths to and through higher education and coupling these experiences with a continued focus on employment, the TPSID program support increased independence as well as personal and professional growth for students with intellectual disability.

This is amazing that we have made this much change in a decade. I don't know of any other field where we have seen us go from 0 to 60 in terms of opportunities, expectations and outcomes. We have a long way to go, everyone is working really hard not just at the NCC that the entire country.

The field of inclusive higher education is really trying to take data and derive meaningful changes in order to move forward.

Having said that if you want any more information please visit our website. I believe the handouts have been updated. I will let Becky or Sheila jump back in.

CLARE PAPAY:

Just quickly I know Carrie we've been messaging and offering resources. If you send an email to the address upon the screen that will get you into our helpdesk system and we will connect you with the right person to answer those questions. We will get you all those resources. Sorry, Becky I cut you off.

SPEAKER:

Totally OK. A great message to share. Anybody at any time can send the message. I like to do a quick poll while people are asking their last questions.

If you could take a minute to fill out this evaluation: it helps us plan future webinars and give feedbacks to the presenters. I'm grateful to Meg, and Claire to take time to assemble this presentation. I thought there were future-- I thought they would for sure never get through it. Great job, ladies.

CLARE PAPAY:

Can answer one remaining question? It was have you found a difference in retaining social skills between persons who attend programs further from their homes are closer to their own. We don't collect data on where students live so we don't have any data to be able to answer that question. That's an easy one.

SPEAKER:

You don't collect data on where they are in relation?

CLARE PAPAY:

Geographically.

MEG GRIGAL:

That kind of study, social engagement is a really tricky and somewhat qualitative aspect. Our tool has to go through (unknown term) review. Social engagement study I actually think is better placed in the program itself. They are a number that are placed to find out and ask the right things. Other ways if you very much like how many times did they go to this? It's a little Nanti sort of. There's a paternal aspect of saying, how many things did they do? They did fewer is that bad? Maybe that was self-determination. Maybe they did not want to do more things.

It's a complex conversation but social engagement and network data I think is better placed in program research.

Next time you do this we will make it longer. (Laughs)'s, everybody. I don't have anything to say in closing, Becky.

SPEAKER:

The recording will be posted on the website in a day or so. Anything you need will be there. You'll get a follow-up email and all the resources related to this webinar will be there. Thanks, everyone. And thank you again for this great presentation.

MEG GRIGAL:

Thanks again, everybody.
