

Q1: What are the benefits of using AI to change reading materials to be closer to a student's independent reading level?

BB: When you're in college and you have a lot of independent reading to do, if it's at your level and you understand the materials, it helps you learn better. It's important to keep the details and key points of the independent reading on your level to be successful on the exam and understand the material.

EB: You can put it to your reading level and if you find a passage and you type it in ChatGPT it will basically paste it and put it at your reading level.

MB: I really liked it because it helped me understand where the passage is coming from. Sometimes the passages can be really hard but at the same time ChatGPT helps me understand.

Q2: Some people are concerned using AI is cheating. How does allowing students to use AI support inclusive post-secondary education?

BB: As a college student, when I read independently I read a lot of different texts that are not summarized. I used ChatGPT in Social Justice Stories and Struggles class this semester. I take my time reading and at the end I ask myself if I understand what they're talking about. I can say "Oh! Now I understand what this means. Like I can say oh.. incarceration is about what happens in prisons now I know what they're talking about." So this isn't cheating because I'm still responsible for knowing the information.

EB: What we just did is somewhat cheating but not really. If that person has a disability they can use this to help them with reading. You can put your reading level onto that thing and it will do what it does. I still had to answer the same questions. Basically AI is like an aide but it's on a computer instead of having an aide in the actual classroom like they have in some classes.

MB: I don't think it's cheating because you're still reading a passage on the screen and you have to answer the same questions. I think giving people reading passages at their own level helps them combine their ideas with their discussion partners and then talk about it with the rest of the class

Q3: Some people think only a teacher should create plain language (about a 6th or 7th grade reading level) instead of teaching students how to make it. What are the benefits of teaching students to use AI independently to convert texts to their individualized reading level?

BB: If the reading levels has big words it can help you to understand the words better. Teachers should encourage students to learn how to use AI because it can help them to understand. I think using AI is a tool to go from college to getting a job. They can use the ChatGPT in work like if someone writes them an email with big words they can highlight their words and they can put it in ChatGPT and ask them to rewrite it for them so they can better understand the other person's thoughts. If a teacher creates it for everyone it might still be too difficult for someone. Instead, teaching the students how to use it helps them to make it match their strengths.

EB: The students can get better at reading. It's much easier to read stuff on this than in a book. I found reading books from the library quite hard sometimes. It's good to make the text match a person individually. I noticed even when I read something at my reading level sometimes it's hard if it's told in a way that's difficult

MB: If the teacher created one version for everyone sometimes the reading is still too hard. If I know how to change it myself I can make the reading best match me and even write a 5 paragraph essay about the passage and read it out loud to the class.

Q4: If a college student's independent reading level is in the early elementary range (Kinder, 1st, 2nd), when setting the AI, should a prompt that uses letters be used instead of numbers? Why or why not? (example: instead of telling the AI to rewrite at a 1st grade level instead they would set it to say rewrite this at a Fountas and Pinnell level G)

BB: It could be harmful to someone's self-confidence to tell them they read at a 1st grade level or 2nd grade level. They might think they're not eligible for college. I'm an aunt of 5. I have a nephew who is in 1st grade. His reading level is not like a college level. If we tell someone they read at a first grade level, they might feel like they're being called a child or they might feel like people are telling them that they don't know things because they have a disability.

EB: If someone told me I read at a first grade level I would say I don't care—that's my reading level. It's the way I understand where the passage is coming from. I think they should use an alternative based off of letters. Even though there's your level and the kid's level an alternative might be easier to read.

MB: If you tell a college student that they read at a first grade level that would make them upset. But if they get to read at the reading level they need then that would make them happy. The letters are better than the grade levels because they can find what they need and it won't make them upset.

Q5: Should the student need to remember their own independent reading level or should the AI setting be used so they can just say "rewrite this for me?" and have it be accurate?

BB: Yes, the settings should be set they can say "rewrite this for me." It is helpful because it's easier for people to remember and understand "rewrite this for me" than it would be to remember what something like Fountas and Pinnell is or the difference between independent reading level and independent reading.

EB: You can use the AI but if you want to read something else maybe remember what your reading level is to be on the safe side.

MB: I think the students should have the customize feature in ChatGPT so they can see what they need. It's better for the technology to remember for them instead of the student having to remember. They can always check the settings to see what they are looking for.
